Monte Carlo methods have been developed into a technique called Monte-Carlo tree search that is useful for searching for the best move in a game. Possible moves are organized in a search tree and a large number of random simulations are used to estimate the long-term potential of each move. A black box simulator represents the opponent's moves.

In computing, a Monte Carlo algorithm is a randomized algorithm whose output may be incorrect with a certain (typically small) probability. Two examples of such algorithms are Karger's Stein algorithm and Monte Carlo algorithm for minimum Feedback arc set.. The name refers to the grand casino in the Principality of Monaco at Monte Carlo, which is well-known around the world as an icon of gambling.

The Monte Carlo simulation results for this project reflect a tight budget, which was indeed the case. This project also had a large amount (US\$400 million) of construction scope, which had been subcontracted on a fixed price contract, thus the construction scope of work risk was on the construction company instead of the project.
